

Registration with Attribution + Redirect

We build with **React 18 + TS + Vite + MUI or Tailwind**, React Query, React Router, and a small modal-stack provider where any component can call `openModal({ type, params })`. The point of this task is **how you capture and preserve marketing attribution across the registration flow** - from first visit through to a successful sign-up.

Build

Routes: `/` (home), `/register`, `/account` (protected). One global modal renderer at the app root - modals are only rendered for authenticated users.

1. URL - Modal

These query params open a different modal on **any page**, on cold load, on back/forward, and on in-app navigation. Modals are only shown to authenticated users - unauthenticated users are redirected to `/register`. Closing a modal removes only its own param.

Query param	Opens modal
<code>?welcome=1</code>	Welcome
<code>?promo=<code></code>	Promo
<code>?invite=<friendId></code>	Invite
<code>?signup=1</code>	Registration

2. Attribution

On first visit, capture `utm_*`, `ref`, `gclid`, `fbclid` and persist. Attribution rules:

- **Same user within 30 days**, not yet registered - keep first-touch, ignore new params.
- **After 30 days**, still not registered - overwrite and reset the clock.

3. Registration

Create a minimal form at `/register` wired to a React Query mutation against a mocked endpoint.

On success:

- Show a toast.
- Include the persisted attribution params in the `POST /register` payload, then clear.
